The present sequence is that of an antifreeze protein of perennial ryegrass. The invention provides forage grass (perennial ryegrass and tayegrass. The invention provides forage grass (perennial ryegrass and tall feature) antifreeze proteins and the polymucleotides encoding them ADM41458-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the polymucleotides can be used to modulate the cold of tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze of polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting cused for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to debydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the cryopreservations in a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the cryopreserve in the control of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and to protect a plant from damage due to

The encoding cDNA was isolated from a root cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADM41458-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting

Perennial

```
The present sequence is that of an antifreeze protein of tall fescue. The encoding cDNA was isolated from a leaf blade cDNA expression library. The encoding cDNA was isolated from a leaf blade cDNA expression library. The convertion provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polynucleotides encoding them ADMA1458-CG ADMA1483. The polynucleotides were isolated from tissues taken at CG different times of year (winter and spring) and from different parts of the plants. The polynucleotides can be used to omodulate the cold cold archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the cold archaea and bacteria. The method involves incorporating an antifreeze polynucleotide into the cils of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be conspected into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be conspected, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a cold fract or fract or fract a plant from damage due to
                                                                                                                                                                                         New antifreeze proteins and encoding polymucleotides, useful for modulating cold tolerance in organisms, as food additives, or for treating tumors or disorders associated with the presence of unwanted

```
The present sequence is that of AFP4, an antifreeze protein of perennial ryegrass. The encoding CDNA was isolated from a leaf and pseudostem CDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polynucleotides contissues taken at different times of year (winter and spring) and from different parts of the plants. The polynucleotides were isolated from different parts of the plants. The polynucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded thereby inhibiting expression of an antifreeze polypeptide. The cattering antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a clisorder characterised by biocrystals associated with disorder such as contractive to destroy unwanted tissue in a patient e.g. tumour tissue, and

different times of year (winter and spring) and from different parts of the plants. The polynucleotides can be used to modulate the cold archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and to protect a plant from damage due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  107. .242

The encoding CDNA was isolated from a basal stem cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polynucleotides encoding them ADM41458-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                   The present sequence is that of APP1, an antifreeze protein of perennial ryegrass. The encoding cDNA was isolated from a pseudostem cDNA ryegrass and tall fescue) antifreeze proteins and the polymucleotides ryegrass and tall fescue) antifreeze proteins and the polymucleotides concoding them ADM41453-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, funst, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded and corresponding to the polymucleotide into the calls of the organism, thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e; tumour tissue, and

This sequence is the plant anti-freeze protein of the invention. The anti-freeze protein is characterised in that at least 40% of its amino acids are from the group of serine, threonine and apparagine. The amino acids protein can be used in frozen food products, especially frozen confectionery. Anti-freeze proteins are especially infood products, on thich are heated, e.g. by pasteurisation, blanching or sterilisation prior to freezing. Plants transformed with a nucleic acid sequence encoding the anti-freeze protein have an increased frost tolerance. Prior at anti-freeze proteins have not been applied to commercially available food products, due to high costs and complicated processes for obtaining the protein. Also prior art anti-freeze proteins have tended to commercially available food products, due to high costs and complicated processes for obtaining the protein. Also prior art anti-freeze protein the pasteurisation step. This is overcome by the present anti-freeze protein. The anti-freeze protein confliction assay of 15 mu M or less. The anti-freeze protein ingredient means that mixes can be frozen under quiescent conditions, e.g. in a shop or minemally obtained via and hence with a texture different to products normally obtained via
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          150 DEEPNTISGTNNSVGSGSNNVVSGNDNTVVSGNNNHVSGSNNTVVTGSDNTVVGSNHVVS 209

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              174 EIHPELCSSSGGIQVLDLSMNRLVGNLD----GLYNCSKSIQQLHIDSNRLTGQLPDYLY 229
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10 MLLVFLGFILQVAGATSWSCHHDDLHALRGLAENLSGKGAVRLRAAW-SGASCCSWEGVG 68

/site_1: EcoRI; Site_2: XhoI; Seeds were
surface-sterilized, Germinated and grown aseptically in
the dark at room temperature on filter paper with water,
nystatin and cefotaxime in covered crystallization
dishes. Five-day old seedlings were transferred to 5 c
cold room and kept for 48 hr. The tissue, total RNA, and
poly(A) RNA were prepared, a cDNA library was made, the CDNA clones were in vivo excised to give pBluescript
phagemids in the TV Close lab (Choi, Close, Fenton) at
the University of California, Riverside. Plasmid DNA
preparations and DNA sequencing were performed in the OD
Anderson lab (all other authors)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           윤
Site_1: EcoRI; Site_2: XhoI; Seeds were germinated and grown at 4 C for 5 weeks. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2600, Sequence 837, Sequence 177, Sequence 171, Sequence 171, Sequence 2, Sequence 2, Sequence 34, Requence 34, Requence 5, Agequence 19, Agequence 11, Agequence 11, Agequence 11, Agequence 11, Agequence 11, Ag

Patent No. 6639063
GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Jobert, S.
APPLICANT: Glordano, J.Y.
TITLE OF INVENTION: ESTS and Encoded Human Proteins.
TITLE REFERENCE: GENSET. 054PR2
CURRENT APPLICATION NUMBER: US/09/621,976
CURRENT PILING DATE: 2000-07-21
NUMBER OF SEQ ID NOS: 19335
SOFTWARE: Patent.pm
SEQ ID NO 15539
LENGTH: 505
NUMBER OF SEQ ID NOS: 989
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 421
                                                                                                                                                                                                                                  3.9%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                        The present sequence is that of cDNA encoding AFP2, an antifreeze protein of perennial ryegrass. The cDNA was isolated from a leaf blade cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polyuncleotides ryegrass and tall fescue) antifreeze proteins and the polyuncleotides or choose taken at different times of year (winter and spring) and from different parts of the plants. The polyuncleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polyuncleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polyuncleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypeptide. The crissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and

                                                                                                                                                                                                                                                                                                                                                                                             ò
                            The present sequence is that of cDNA encoding an antifreeze protein of tall fescue. The cDNA was isolated from a leaf blade cDNA expression labrary. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADM41458-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of agene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kindey stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and to protect a plant from damage due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             186
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           246

Lail resource, the turne are turne area. According to the invention provides forgets are all the turnention provides forgets (perennial typegrass and tall library. The invention provides were isolated from tissues taken at different times of year (winter and spring) and from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold corporation of an organism, especially plants, mammals, insects, fungi, archaec and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, thereby inhibiting expression of an antifreeze polymucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze protein can be consolition, to trissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and to protect a plant from damage due to
      ŏ
present sequence is that of cDNA encoding an antifreeze protein (fescue. The cDNA was isolated from a leaf blade cDNA expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         frost or freezing

The present sequence is that of cDNA encoding, an antifreeze protein of perennial ryegrass. The cDNA was isolated from a leaf and pseudostem cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifrese proteins and the polynucleotides encoding them ADM41458-ADM41483. The polynucleotides were isolated from tissues taken at different times of year (winter and spring) and from
